Being a web hosting provider, we offer you solutions that are beyond compare in the web industry. We provide hosting services that will not only secure your servers and the data therein, but also ensure that your websites are available on the web 24X7X365.

Privacy is the control of one's own personal information, control over what others know about one, and control over how others may use or exploit the personal information. Policies and practices for protecting privacy aim towards minimizing the collection of personally identifiable information. Therefore, the basis of privacy is anonymity, where no personally identifiable information is collected. Making compulsory, the disclosure of personally identifiable information, as under current WhoIs policies for domain registration, cause privacy to be undermined

Privacy and data protection laws may apply to domain registrars' WhoIs services and registrars' participation in thick registry WhoIs services in various countries, particularly in the European Union's member states.

Current ICANN regulations require that the Private contact information (WhoIs Info) of each domain registration be included in a publicly accessible Database.

The WhoIs database is the collection of information gathered by a domain name registrar from domain name registrants.

The purpose for which the WhoIs system is accessed includes:

- To find out whether a specific domain name is unregistered and currently available
- To identify the person or organization responsible for a domain registration or website on the Internet.
- To support technical operations of Internet Service Providers or network administrators, including assistance in tracing sources of Spam or denial of service attacks.
- To collect names and contact information for the purpose of marketing.
- To aid government law enforcement, other than intellectual property

When a WhoIs search is conducted, the information that is currently available about the domain name registrant leads to the name and address of the domain name owner.

However, when a domain name is registered, the personal contact information such as name, address, email address, and even phone number might be made freely available.

The domain registrant would not know who collected his/her WhoIs data, the reason for which the information was collected, and how the collector is likely to use the information

This implies that the private information is displayed and made available to whoever wants to see it, at any point of time.

Now it is possible to protect one's private WhoIs information by switching the "public" domain registration to a "private" unlisted registration through a private WhoIs service.

A private WhoIs service protects the private information and shields against its misuse. Hence, one is protected against:

- Spam
- Identity Theft
- Data Mining
- Name Hijackers

It works in a similar way to having one's phone number "unlisted" and it prevents people from gaining access to one's address, phone number and other such private information.

A Private WhoIs service works by:

- Protecting the private information.
- Relaying important communication
- Providing greater control

Protecting the Private Information

This implies that the private contact information is not exposed and is held confidentially, and protected by the Domain Privacy Protection Service. Instead of the individual's contact information, their contact information is displayed to provide with the highest level of protection against spammers and identity theft.

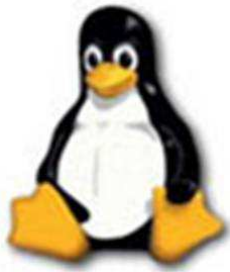

Relaying Important Communication

Without a private WhoIs service, those involved in spamming can obtain email addresses through harvesting and then use these for sending spam mails and redistribution to marketing firms. The email addresses can stay on record with various spammers and marketing firms for several years. With a private WhoIs service, the visible email address is constantly changing, so it will change within a specific period of time and the previous address will not work for the spammer. The Domain Privacy Protection Service secures and maintains the real email address on record so that important information regarding the domain is received.

Providing Greater Control

The individual or organization subscribing to the private WhoIs service retains full legal ownership and control over the domain registration. It is possible to sell, renew, transfer and change settings to the domain name just the same as otherwise. The domain control panel provides real-time access to easily manage the domain name.

Linux Web hosting

Linux web hosting (sometime referred to as LAMP - Linux, Apache, MySQL & PHP) solutions are suitable for webmasters who use Linux hosting features, such as Perl programming, PHP programming and MySQL database. Linux web site hosting is a powerful and reliable hosting solution, and because Linux is open source software, it is usually very cheap. B you will find the best Linux plans on the market, ranked by value for money, quality, and reliability.

Linux Web hosting and Unix Web Hosting are the most common budget hosting platforms used today. Linux web hosts and Linux web hosting companies are similar to UNIX web hosts.

The cheap hosting industry has allowed UNIX web hosts to provide enormous amounts of space in their web hosting plans with lots of installed features with UNIX and Linux hosting.

Windows Web hosting

Windows hosting makes use of Microsoft's Windows software for the web hosting server for your websites and give you environment to run ASP.net

ASP.net is sort of web application with power of windows server environment. In comparison to Linux hosting, Windows hosting allows a better user friendly interface with Microsoft's own products and services. Windows hosting supports all the popular windows web services used in web development, allowing an individual to make a website or web application in the language of one's preference.

Windows Hosting is more user friendly and carries more benefits that are the reason why it is so widely used. Each operating system has its own unique features, and this brings their own advantages and disadvantages. Linux platforms do not offer support for the dot NET technologies, which includes ASP.net.

If you have already built a website using Microsoft dot NET technologies then you may know the benefits of using this service. If you are planning to design a website with Microsoft FrontPage or a web application using Active Server Pages (ASP) or any of the Microsoft application then Windows hosting is the solution that you should go for.

It is said that Windows hosting are often slower than Linux hosting in performance but it proves a very cost effective choice from using hardware efficiently whereas Linux hosting is incredibly efficient and gives you some of the cheap hosting options available but does not support applications like ASP or ASP dot Net applications which use windows platform to run.

These web hosts can also be used as data center space and inter connectivity service for the Internet as web hosting is done in a safe and secure manner with a number of anti spam filtering your data is always in secure hands or rather you can say on secure servers. Customers get a quick account setup and they can easily administer there hosting account with the control panel provided by the hosting provider which is a traditional way of the control panel. Sometime those websites which are hosted on shared server experience some problems than from those websites which are placed on a dedicated web server as the result of higher volumes of traffic cannot be controlled or managed by these types of servers.

Reseller Hosting

If one needs to define reseller hosting, what can be the way to do it? It would be as a web hosting resulting from a habitual work. In such sort of hosting, the account owner might divide the space of hard drive to two or more parts and sell it to any other person, for doing so there are several points in support like one simply don't

need the space and wants to make some money by selling it to others but, root lies in the fact that this market is not only enthusiastic but also contains immense competition in it.

Talking about Reseller Hosting, it is established in such a manner that resellers can deliver this extra space with ease to anyone else without the tension of upholding of sold hosting. This is because it is owner's responsibility to uphold the service of his/her particular dedicated server.

Now the question is by what way it is going to affect a particular user? It is GUI control panels which assist the user to make an easy use of reseller hosting. It doesn't matter whether the user is purchasing or selling the hosting, these panels assist them to do the work rightly and rapidly without any biasness. Below mentioned web hosting resellers are the prior choices in commercial control panels:

1. Plesk 2. Direct Admin 3. CPanel 4. H-Sphere 5. Ensim
